

Boiler Water Treatment

Untreated or poorly treated boiler make-up water, boiler water and water in central heating systems cause problems in many installations. Among the most common are corrosion and the deposition of scale. These lead to a reduction in the heat transfer rate, excessive water use, loss of heat production and eventually probable system failure.

These problems can be avoided by using of our Boiler Water Treatment. This is a unique facility which combines conditioning products, dosing and control equipment, and is reinforced by our professional support during treatment. The result is water and energy consumption are greatly

reduced while efficiency and longevity of the boiler is increased.

We are proud of our comprehensive service, confident that it is the best available.

Make Lubron your first choice for water treatment in your boiler and heating system.

Boiler Water Treatment

HOW IT WORKS

After a thorough appraisal of your boiling or heating system by our specialist staff we will recommend a specific, optimised water treatment programme. This has three distinct focal points:

- To minimise any scale deposits and corrosion in your boiler or heating system
- To minimise water and energy consumption
- To ensure optimum efficiency and long-life to the system through regular service and on-going support by experienced technicians.

OUR BOILER WATER PRODUCTS

Resulting from extensive research and many years' experience we offer the following:

- Up-to-date conditioning and dispersant products to control sludge and scale
- The latest organic and inorganic oxygen scavengers
- Steam condensate treatment
- Alkaline builders and adjuncts
- Dosing and control equipment, including remote monitoring
- Pre-treatment and filtration plant
- On-line cleaning products
- Test kits

The conditioning products are easily administered using our specially designed dosing and control equipment. In many instances, appropriate pre-treatment results in reduced consumption of both water and conditioning products.

LUBRON SUPPORT

Lubron offer a total support package from survey through design, build and application of the optimum technology to after sales service and support.

At Lubron we live for quality. We offer you comprehensive service and support - including analysis of your water and site inspections - in order to maintain your water treatment at an optimum and ensure compliance with regulations. You will also receive a detailed report and carefully considered advice after each site visit.
